ABSTRACT OF THE DISCLOSURE

        The filtering system includes the incorrect request database that stores patterns of incorrect accesses to the Web server.   The estimation unit that estimates the
5   correctness of an access request from a client device based on the patterns stored in the incorrect request database and a predetermined estimation rule.   The decision unit decides whether the access request is to be passed to the Web server based on the result of estimation by the estimation
10   unit and a predetermined decision rule.
